Physics with a Multi-Megawatt Source Workshop, May 2004

Outline

- 1 Definition and Goals of a Proton Driver
- 2 Existing Machines and Machines under Construction: ISIS, SNS, J-PARC
 - The ISIS Spallation Neutron Source
 - The US Spallation Neutron Source
 - J-PARC 3 GeV and 50 GeV Synchrotrons
- 3 The synchrotron approach towards achieving the goals
 - RAL RCS Designs for a Proton Driver
 - 30 GeV Slow Cycling Synchrotron
 - Fermilab 8 GeV Synchrotron
 - Development of ISIS into a dual purpose facility
- 4 Problems & Conclusions

Definition and Goals

Definition

A proton driver must

- 1 provide megawatt levels of proton beam power
- 2 be capable of generating short intense proton bunches

Approaches

- 1 A full energy linac feeding accumulator and compressor rings (e.g. CERN Neutrino Factory design)
- 2 An intermediate energy linac with subsequent accumulation, acceleration and compression carried out in a single synchrotron or chain of synchrotrons (RAL, J-PARC, FNAL, BNL)

The ISIS Spallation Neutron Source

Features

- 70 MeV H⁻ linac
- Accumulation in synchrotron
- Acceleration to 800 MeV
- 0.16 to 0.24 MW upgrade in progress

- Charge exchange injection into synchrotron via Al₂O₃ foil
- 2.5×10^{13} protons per pulse at 50 Hz
- 2 bunches, each ~ 100 ns duration at target

 - 30 GeV Slow Cycling Synchrotron
 - Fermilab 8 GeV Synchrotron
 - Development of ISIS into a dual purpose facility
- 4 Problems & Conclusions

The US Spallation Neutron Source, SNS

- 1 GeV H^- superconducting linac
- 1060 turn charge exchange injection
- 60 Hz rep rate
- 1.5×10^{14} protons accumulated per pulse
- 1.4 MW beam power with $\sim 1 \mu s$ pulses
- Due on line 2006

 - 30 GeV Slow Cycling Synchrotron
 - Fermilab 8 GeV Synchrotron
 - Development of ISIS into a dual purpose facility
- 4 Problems & Conclusions

J-PARC 3 GeV and 50 GeV Synchrotron System

- 400 MeV H^- linac
- 3 GeV neutron source, 1 MW
- 50 GeV main ring, 0.75 MW
- Facilities for transmutation and neutrino superbeams
- Study of full Neutrino Factory based on FFAGs
- Commissioning 3 GeV ring in 2006

Philosophy behind the Synchrotron Approach

Essential Considerations

- Building up the intensity through multiturn injection is a difficult task
- Bunch compression to nanosecond time durations imposes entirely different demands on the accelerator
- There are severe space charge problems at MW levels of intensity and these levels of bunch compression
- Short bunch requirement means small longitudinal emittance, which is best achieved at lower energy

$$A = \frac{8R\alpha}{hc} \sqrt{\frac{2\gamma(1 - \eta_{SC})VE_0}{\pi h|\eta|}} \implies \gamma, \frac{1}{h}, \frac{1}{|\eta|} \text{ min.}$$

$$\eta_{SC} = \frac{N_e h^2}{2\epsilon_0 R F \gamma^2 V} \lesssim 0.4$$

Theoretical Models and Future Plans

- Suggests using separate rings for accumulation and compression
 - Fundamentally different beam optics possible in each ring
 - Pairs of rings can also be used to split beam and reduce space charge
-
- RAL designs
 - 1 5 GeV, 50 Hz, 4 MW scenario (green field site)
 - 2 15 GeV, 25 Hz, 4 MW model (to fit ISR tunnel)
 - 3 30 GeV, 8 Hz synchrotron for PS replacement
 - Fermilab 8 GeV Synchrotron
 - ISIS upgrades
 - Dual purpose neutron/neutrino source

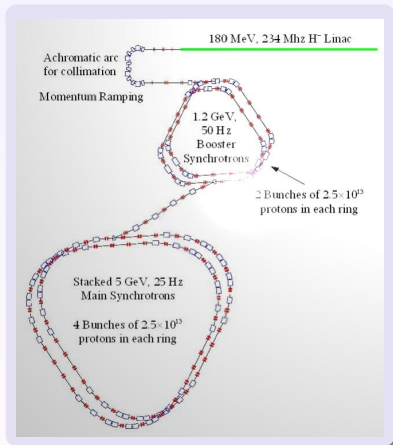

Theoretical Models and Future Plans

- Suggests using separate rings for accumulation and compression
 - Fundamentally different beam optics possible in each ring
 - Pairs of rings can also be used to split beam and reduce space charge
-
- RAL designs
 - ① 5 GeV, 50 Hz, 4 MW scenario (green field site)
 - ② 15 GeV, 25 Hz, 4 MW model (to fit ISR tunnel)
 - ③ 30 GeV, 8 Hz synchrotron for PS replacement
 - Fermilab 8 GeV Synchrotron
 - ISIS upgrades
 - Dual purpose neutron/neutrino source

 - Fermilab 8 GeV Synchrotron
 - Development of ISIS into a dual purpose facility
- 4 Problems & Conclusions

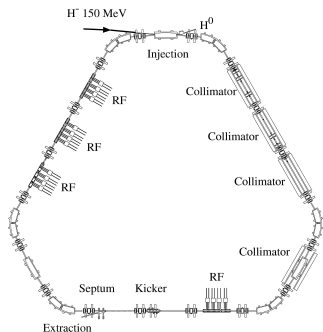

RAL 5 GeV, 50 Hz, 4 MW Driver

- "Proof of Principle Study"
- Based on double rings of radii in ratio 1:2, frequencies 2:1
- Beam prepared for injection in linac and achromatic arc
- Charge exchange injection via Al_2O_3 foil in booster rings: loss at 10^{-4} level mainly from scattering in foil
- Acceleration in main synchrotrons with ns bunch compression achieved with combination of RF harmonics

1.2 GeV Booster Synchrotron

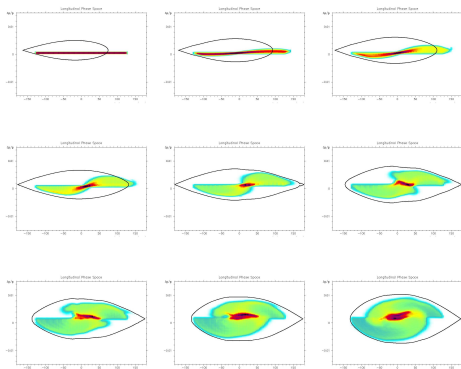

- Triplet booster lattice
 - separate superperiods for collimation, RF and extraction
 - injection in low field dipole (~ 0.05 T) with $\frac{D_x}{\sqrt{\beta_x}} = 1.6$

Foil heating from stripping and subsequent proton traversals is a concern, particularly in full-energy linac-accumulator ring designs, where temperatures can reach ~ 2500 K.

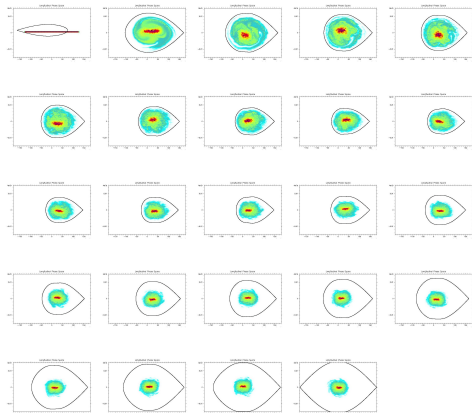

Simulation of Injection at 180 MeV

- Chopped beam allows full capture as longitudinal bucket increases with time.
- $\frac{\Delta p}{p}$ painting, RF steering and variable peak cavity voltages assist trapping and help control bunching factor (transverse space charge)

Simulation of Acceleration Cycle 0.18 to 1.2 GeV

- 0% beam loss predicted
- Output bunch length ~ 100 ns

5 GeV Model: Optical Details

Booster Lattice

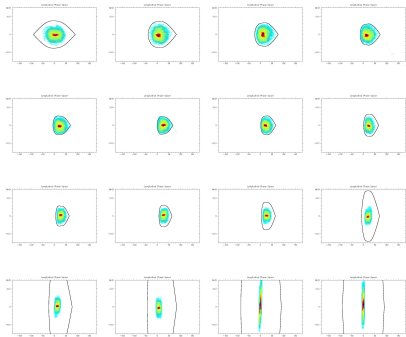

Main Ring

- Main ring uses simple FODO lattice
- Compression to 1 ns achieved as $\gamma \rightarrow \gamma_t$
- Main ring resistant to optical effects of severe space charge ($I \sim 1000$ A)

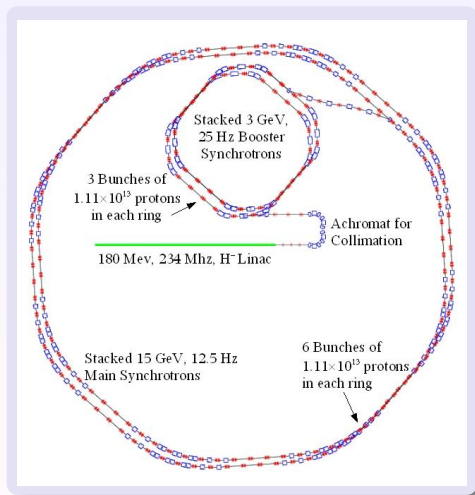

Simulation of Main Acceleration and Compression 1.2 to 5 GeV

- 0.2% beam loss on transfer
- Final bunch length ~ 2 ns
- Achieved with combination of $h = 8/h = 24$ RF harmonics

RAL 15 GeV, 25 Hz, 4 MW Driver

- Main ring 151 m mean radius to fit ISR tunnel
- Principles similar to 5 GeV driver
- Await results from HARP for optimal final beam energy

- 4 Problems & Conclusions

A 30 GeV, 8 Hz Synchrotron as Possible Replacement for CERN PS

- 180 MeV H^- Linac with 2.5 MeV fast beam chopper
- Achromatic arc with high normalised dispersion
- Momentum ramping for injection painting
- bunch compression

 - Development of ISIS into a dual purpose facility
- 4 Problems & Conclusions

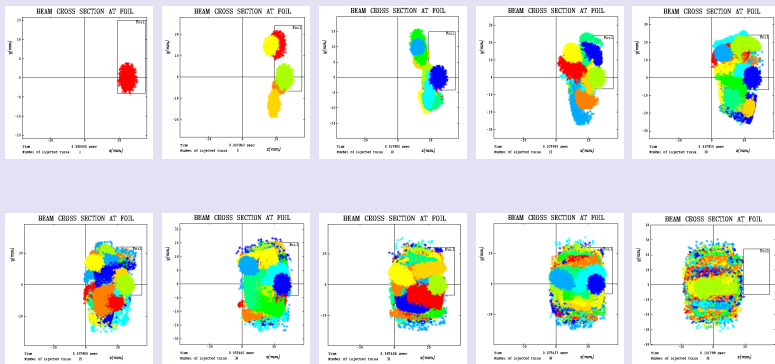

Fermilab 8 GeV Synchrotron-based Proton Driver

- Improved booster for main injector
- Racetrack lattice, 75 m mean radius
- Based on RAL design

Fermilab: Simulation of Transverse Injection

S-bend Model; 20 turns, 26 revolutions

- 4 Problems & Conclusions

Phased Upgrade of ISIS

Phase 1

- Addition of new synchrotron, 78 m radius (*cf* FNAL)
- 1 MW neutron source at 3 GeV (50 Hz) and NF test-bed at 6 or 8 GeV (16.7 Hz)
- Test of bunch compression and NF target experiments

Phased Upgrade of ISIS

Phase 1

- Addition of new synchrotron, 78 m radius (*cf* FNAL)
- 1 MW neutron source at 3 GeV (50 Hz) and NF test-bed at 6 or 8 GeV (16.7 Hz)
- Test of bunch compression and NF target experiments

Acceleration using combined harmonic magnetic field to reduce peak RF

$$B(t) = B_0 - B_1 \cos 2\pi ft + \frac{B_1}{\sqrt{6}} \sin 4\pi ft$$

Phases 2

- Replacement of current ISIS synchrotron with new booster
 - two stacked rings, 39 m radius
 - 180 MeV to 1.2 GeV

Phase 3

- Construction of second main synchrotron
- Full 4-5 MW proton driver

The Electron Cloud Study at ISIS

- A major concern for high intensity proton drivers
- Limits intensity at LANL PSR
- Not seen at ISIS but why not?
- Many ISIS features built into RCS MW designs
 - RF shields in dipoles and quadrupoles
 - Tapered vacuum chambers (rectangular)
- Computational/experimental study in progress

Summary of Problems Facing an RCS-based Proton Driver

- Very low uncontrolled beam loss for hands-on maintenance: requires carefully designed collimation system
- Injection trapping: low energy fast beam chopper in linac and controlled RF voltages
- Excessively high stripping foil temperatures: injection painting
- Instabilities, particularly electron cloud
- Multiple harmonic accelerating magnet design to reduce \dot{B} and V_{peak}

Conclusions

- A 4 MW RCS-base proton driver appears feasible and provides a flexible solution to accumulation and bunch compression
- Following development work over the past decade on ESS, SNS and J-PARC, there are no obvious show-stoppers
- The phased upgrade of ISIS is an attractive option with a minimum disruption to user facilities
- BUT the step from 0.16 MW to 4 MW is huge.
- Preliminary cost estimates suggest RCS and LAR scenarios are roughly the same price, but the cost depends on the site and existing infra-structure

Conclusions
